

Part 2

①

1] Entry Point :

Shibuya Crossing
★★★★
● 3 Alternatives

Restaurant

Schiran Ramen
★★★★
● 4 Alternatives

2] click flow:

user will click 3 Alternatives

Inline Drawer expands directly below the card

Shibuya Crossing ★★★★ 3 Alternatives
Alternative 1 Tokyo Skytree ★★★★★ 2 Km, Free cancellation [swap]
Alternative 2 Sensaji ★★★★ 1 Km, Top Rated [swap]
Alternate 3 Ueno Park ★★★★ Nature [swap]

3) Reason for using Inline Drawer.

Users are already planning their itinerary. Opening a modal breaks context.

So, Inline expansion allows users to compare without losing the timeline.

4) Works for all slot types, not just one.

a) Restaurant:

Ichiran Ramen --> 3 Alternatives --> Drawer --> Swap

b) Activity:

Shibuya Crossing --> 3 Alternatives --> Drawer --> Swap

c) Stay:

Park Hotel Tokyo --> 2 Alternatives --> Drawer --> Swap

d) Transfer:

Taxi --> 2 Alternatives --> Drawer --> Swap

5) How it fits Rimigo's existing theme and layout?

I will use an inline expandable drawer below each itinerary slot instead of a modal or new page.

This keeps the user on the same itinerary screen and matches Rimigo's existing card-based layout.

Each slot (Activity, Restaurant, Stay, Transfer, etc.) will have a small "n Alternatives" button.

When clicked, a list of suggested alternatives will appear below the selected card with a Swap button for each of them.

This approach:

- # Keeps the existing UI unchanged
- # Maintains the user's planning flow
- # Uses the same card style, spacing, colors, and border radius
- # Works consistently for all slot types

6) Edge Cases:

1. No Alternatives Available:

Show a simple message: "No alternatives available. Continue with your current selection."

2. Loading State:

Display skeleton loading cards until the alternatives are loaded.

3. Long List

Show alternatives inside a scrollable drawer with a fixed height so the itinerary remains clean.

4. Mobile Behaviour

Instead of an inline drawer, show the alternatives in a bottom sheet for better usability on small screens.
